Editorial

Consider the following game:

- There are two players, *First* and *Second*, sitting in front of a pile of  $n$  stones. *First* always plays first.
- There is a set,  $S$ , of  $m$  distinct integers defined as  $S = \{s_0, s_1, \dots, s_{m-1}\}$ .
- The players move in alternating turns. During each turn, a player chooses some  $s_i \in S$  and splits one of the piles into exactly  $s_i$  smaller piles of equal size. If no  $s_i$  exists that will split one of the available piles into exactly  $s_i$  equal smaller piles, the player loses.
- Both players always play optimally.

Given  $n$ ,  $m$ , and the contents of  $S$ , find and print the winner of the game. If *First* wins, print `First`; otherwise, print `Second`.

## Input Format

The first line contains two space-separated integers describing the respective values of  $n$  (the size of the initial pile) and  $m$  (the size of the set). The second line contains  $m$  distinct space-separated integers describing the respective values of  $s_0, s_1, \dots, s_{m-1}$ .

## Constraints

- $1 \leq n \leq 10^{18}$
- $1 \leq m \leq 10$
- $2 \leq s_i \leq 10^{18}$

## Output Format

Print `First` if the *First* player wins the game; otherwise, print `Second`.

## Sample Input 0

```
15 3
5 2 3
```

## Sample Output 0

Second

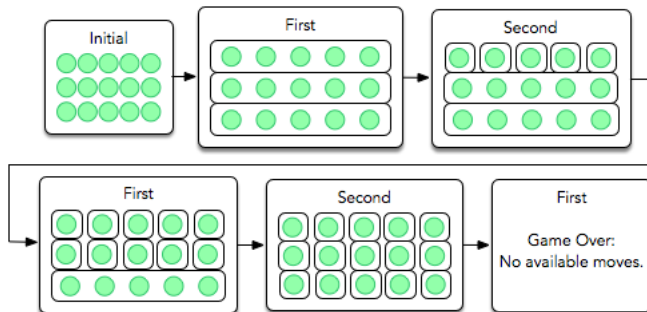

## Explanation 0

The initial pile has  $n = 15$  stones, and  $S = \{5, 2, 3\}$ . During *First*'s initial turn, they have two options:

1. Split the initial pile into **5** equal piles, which forces them to lose after the following sequence of turns:

2. Split the initial pile into **3** equal piles, which forces them to lose after the following sequence of turns:

Because *First* never has any possible move that puts them on the path to winning, we print *Second* as our answer.
