Editorial

Given a graph consisting N nodes (labelled 1 to N) where a specific given node S represents the starting position S and an edge between two nodes is of a given length, which may or may not be equal to other lengths in the graph.

It is required to calculate the shortest distance from the start position (Node S) to all of the other nodes in the graph.

Note: If a node is unreachable, the distance is assumed as -1 .

Input Format

The first line contains T , denoting the number of test cases.

First line of each test case has two integers N , denoting the number of nodes in the graph and M , denoting the number of edges in the graph.

The next M lines each consist of three space-separated integers $x y r$, where x and y denote the two nodes between which the **undirected** edge exists, r denotes the length of edge between these corresponding nodes.

The last line has an integer S , denoting the starting position.

Constraints

$$1 \leq T \leq 10$$

$$2 \leq N \leq 3000$$

$$1 \leq M \leq \frac{N \times (N-1)}{2}$$

$$1 \leq x, y, S \leq N$$

$$1 \leq r \leq 10^5$$

If there are edges between the same pair of nodes with different weights, they are to be considered as is, like multiple edges.

Output Format

For each of the T test cases, print a single line consisting $N - 1$ space separated integers denoting the shortest distance of $N - 1$ nodes other than S from starting position S in increasing order of their labels.

For unreachable nodes, print -1 .

Sample Input

```
1
4 4
1 2 24
1 4 20
3 1 3
4 3 12
1
```

Sample Output

```
24 3 15
```

Explanation

The graph given in the test case is shown as :

- The straight line is a weighted edge, denoting length of edge between the corresponding nodes.
- The nodes S,B,C and D denote the obvious node 1,2,3 and 4 in the test case.

The shortest paths followed for the three nodes B,C and D are as follows :

S->B - Shortest Path Value : **24**

S->C - Shortest Path Value : **3**

S->C->D - Shortest Path Value : **15**
