# Shashank and the Palindromic Strings

Problem Submissions Leaderboard Discussions Editorial

Shashank loves strings, but he loves palindromic strings the most. He has a list of n strings,  $A = [a_0, a_1, \ldots, a_{n-1}]$ , where each string,  $a_i$ , consists of lowercase English alphabetic letters. Shashank wants to count the number of ways of choosing non-empty subsequences  $s_0, s_1, s_2, \ldots, s_{n-1}$  such that the following conditions are satisfied:

1.  $s_0$  is a subsequence of string  $a_0$ ,  $s_1$  is a subsequence of string  $a_1$ ,  $s_2$  is a subsequence of string  $a_2$ , ..., and  $s_{n-1}$  is a subsequence of string  $a_{n-1}$ .

2.  $s_0 + s_1 + s_2 + \ldots + s_{n-1}$  is a palindromic string, where + denotes the string concatenation operator.

You are given q queries where each query consists of some list, A. For each query, find and print the number of ways Shashank can choose n non-empty subsequences satisfying the criteria above, modulo  $10^9 + 7$ , on a new line.

**Note:** Two subsequences consisting of the same characters are considered to be different if their characters came from different indices in the original string.

#### **Input Format**

The first line contains a single integer, q, denoting the number of queries. The subsequent lines describe each query in the following format:

- ullet The first line contains an integer,  $oldsymbol{n}$ , denoting the size of the list.
- Each line i of the n subsequent lines contains a non-empty string describing  $a_i$ .

#### Constraints

- $1 \le q \le 50$
- $1 \le n \le 50$
- $ullet \sum_{i=0}^{n-1} |a_i| \leq 1000$  over a test case.

For 40% of the maximum score:

- $1 \le n \le 5$
- $\sum_{i=0}^{n-1} |a_i| \leq 250$  over a test case.

### **Output Format**

For each query, print the number of ways of choosing non-empty subsequences, modulo  $10^9+7$ , on a new line.

## Sample Input 0

3 aa b aa 16/11/2017 HackerRank

b c 2 abc

abc

Sample Output 0

5

#### **Explanation 0**

The first two queries are explained below:

1. We can choose the following five subsequences:

```
1. s_0 = "a", s_1 = "b", s_2 = "a", where s_0 is the first character of a_0 and s_2 is the first character of a_2.
```

2. 
$$s_0 = \mathbf{a}^{\mathsf{u}}$$
,  $s_1 = \mathbf{b}^{\mathsf{u}}$ ,  $s_2 = \mathbf{a}^{\mathsf{u}}$ , where  $s_0$  is the second character of  $a_0$  and  $s_2$  is the second character of  $a_2$ .

3. 
$$s_0 = \mathbf{a}^{\mathsf{u}}$$
,  $s_1 = \mathbf{b}^{\mathsf{u}}$ ,  $s_2 = \mathbf{a}^{\mathsf{u}}$ , where  $s_0$  is the first character of  $a_0$  and  $s_2$  is the second character of  $a_2$ .

4. 
$$s_0 = "a"$$
,  $s_1 = "b"$ ,  $s_2 = "a"$ , where  $s_0$  is the second character of  $a_0$  and  $s_2$  is the first character of  $a_2$ .

5. 
$$s_0 =$$
"aa",  $s_1 =$ "b",  $s_2 =$ "aa"

Thus, we print the result of  $5 \mod (10^9 + 7) = 5$  on a new line.

2. There is no way to choose non-empty subsequences such that their concatenation results in a palindrome, as each string contains unique characters. Thus, we print **0** on a new line.
