Lena Sort

Lena developed a sorting algorithm described by the following pseudocode:

```
lena_sort(array nums) {
    if (nums.size <= 1) {</pre>
        return nums;
    pivot = nums[0];
    array less;
    array more;
    for (i = 1; i < nums.size; ++i) {
        // Comparison
        if (nums[i] < pivot) {</pre>
            less.append(nums[i]);
        else {
            more.append(nums[i]);
    sorted_less = lena_sort(less);
    sorted_more = lena_sort(more);
    ans = sorted_less + pivot + sorted_more;
    return ans;
}
```

We consider a *comparison* to be any time some nums[i] is compared with pivot.

You must solve q queries where each query i consists of some len_i and c_i . For each query, construct an array of len_i distinct elements in the inclusive range between 1 and 10^9 that will be sorted by $lena_sort$ in exactly c_i comparisons, then print each respective element of the unsorted array as a single line of len_i space-separated integers; if no such array exists, print -1 instead.

Input Format

The first line contains a single integer denoting q (the number of queries).

Each line i of the q subsequent lines contains two space-separated integers describing the respective values of len_i (the length of the array) and c_i (the number of comparisons) for query i.

Constraints

- $1 \le q \le 10^5$
- $1 \le len_i \le 10^5$
- $0 \le c_i \le 10^9$
- $1 \le$ the sum of len_i over all queries $\le 10^6$

Output Format

Print the answer to each query on a new line. For each query *i*, print *len_i* space-separated integers describing each respective element in an unsorted array that Lena's algorithm will sort in exactly *c_i* comparisons; if no such array exists, print -1 instead.

Sample Input 0

5 6 5 100

Sample Output 0

4 2 1 3 5 -1

Explanation 0

We perform the following q = 2 queries:

- 1. One array with len = 5 elements is [4, 2, 1, 3, 5]. The sequence of sorting operations looks like this:
 - Run lena_sort on [4, 2, 1, 3, 5]. Compare *pivot* = 4 with 2, 1, 3, and 5 for a total of 4 comparisons. We're then left with *less* = [2, 1, 3] and *more* = [5]; we only need to continue sorting *less*, as *more* is sorted with respect to itself because it only contains one element.
 - Run lena_sort on less = [2, 1, 3]. Compare pivot = 2 with 1 and 3 for a total of 2 comparisons. We're then left with less = [1] and more = [3], so we stop sorting.

We sorted [4,2,1,3,5] in 4+2=6 comparisons and c=6, so we print 4 2 1 3 5 on a new line.

2. It's not possible to construct an array with len = 5 elements that $lena_sort$ will sort in exactly c = 100 comparisons, so we print -1 on a new line.

Sample Input 1

3 2

Sample Output 1

1 4 3 2 1 2 1 3

Explanation 1

We perform the following q = 3 queries:

- 1. We want an array with len = 1 element that $lena_sort$ sorts in c = 0 comparisons; any array with 1 element is already sorted (i.e., $lena_sort$ performs 0 comparisons), so we choose [1] as our array and print 1 on a new line.
- 2. One array with len = 4 elements is [4,3,2,1]; sorting it with $lena_sort$ looks like this:
 - lena_sort on [4, 3, 2, 1]. Compare *pivot* = 4 with 3, 2, and 1 for a total of 3 comparisons. We're then left with *less* = [3, 2, 1] and *more* = []; we only need to continue sorting *less*, as *more* is empty.
 - Run lena_sort on less = [3, 2, 1]. Compare pivot = 3 with 2 and 1 for a total of 2 comparisons. We're then left with less = [1, 2] and more = [], so we only continue sorting less.
 - Run lena_sort on less = [2, 1]. Compare pivot = 2 with 1 for a total of 1 comparison. We then stop sorting, as less = [1] and more = [1]

We sorted [4,3,2,1] in 3+2+1=6 comparisons and c=6, so we print 4 3 2 1 on a new line.

3. One array with len = 3 elements is [2, 1, 3]. When we run $lena_sort$ on it, we compare pivot = 2 with 1 and 3 for a total of 2 comparisons. We're then left with less = [1] and more = [3], so we stop sorting.

We sorted [2,1,3] in 2 comparisons and c=2, so we print 2 1 3 on a new line.
