Breadth First Search: Shortest Reach

Problem	Submissions	Leaderboard	Discussions	Editorial 🔒

Consider an undirected graph consisting of n nodes where each node is labeled from 1 to n and the edge between any two nodes is always of length n . We define node n to be the starting position for a BFS.

Given q queries in the form of a graph and some starting node, s, perform each query by calculating the shortest distance from starting node s to all the other nodes in the graph. Then print a single line of n-1 space-separated integers listing node s's shortest distance to each of the n-1 other nodes (ordered sequentially by node number); if s is disconnected from a node, print s as the distance to that node.

Input Format

The first line contains an integer, q, denoting the number of queries. The subsequent lines describe each query in the following format:

- The first line contains two space-separated integers describing the respective values of *n* (the number of nodes) and *m* (the number of edges) in the graph.
- ullet Each line $m{i}$ of the $m{m}$ subsequent lines contains two space-separated integers, $m{u}$ and $m{v}$, describing an edge connecting node $m{u}$ to node $m{v}$.
- The last line contains a single integer, **s**, denoting the index of the starting node.

Constraints

- $1 \le q \le 10$
- $2 \le n \le 1000$
- $1 \le m \le \frac{n \cdot (n-1)}{2}$
- $1 \leq u, v, s \leq n$

Output Format

For each of the q queries, print a single line of n-1 space-separated integers denoting the shortest distances to each of the n-1 other nodes from starting position s. These distances should be listed sequentially by node number (i.e., $1, 2, \ldots, n$), but should not include node s. If some node is unreachable from s, print s as the distance to that node.

Sample Input

- 2
- 4 2 1 2
- 1 :
- 1
- 3 1
- 2 3

Sample Output

- 6 6 -1
- -1 6

Explanation

We perform the following two queries:

1. The given graph can be represented as:

where our *start* node, \mathbf{s} , is node $\mathbf{1}$. The shortest distances from \mathbf{s} to the other nodes are one edge to node $\mathbf{2}$, one edge to node $\mathbf{3}$, and an infinite distance to node $\mathbf{4}$ (which it's not connected to). We then print node $\mathbf{1}$'s distance to nodes $\mathbf{2}$, $\mathbf{3}$, and $\mathbf{4}$ (respectively) as a single line of space-separated integers: $\mathbf{6}$, $\mathbf{6}$, $\mathbf{-1}$.

2. The given graph can be represented as:

where our *start* node, *s*, is node **2**. There is only one edge here, so node **1** is unreachable from node **2** and node **3** has one edge connecting it to node **2**. We then print node **2**'s distance to nodes **1** and **3** (respectively) as a single line of space-separated integers: -1 6.

Note: Recall that the actual length of each edge is 6, and we print -1 as the distance to any node that's unreachable from s.
